1 Question

A square, of each side 2, lies above the x-axis and has one vertex at the origin. If one of the sides passing through the origin makes an angle 30° with the positive direction of the x-axis, then find the sum of the x-coordinates of the vertices of the square.

2 solution

Consider a line which has slope $\tan\theta$ and passes through the point $A(x_1, y_1)$.

Let $P(x, y)$ be a point on the line which is at a distance r from the point A .

We have, $\cos\theta = AQ/AP = (x-x_1)/r$ and $\sin\theta = PQ/AP = (y-y_1)/r$

This gives the coordinates of P as $(x_1 + r\cos\theta, y_1 + r\sin\theta)$.

And this is the parametric form of the equation of a straight line: $x = x_1 + r\cos\theta$, $y = y_1 + r\sin\theta$.

This can also be written in a fancy way as $x x_1 / \cos\theta = y y_1 / \sin\theta = r$

Given length of side is 2 units and one of the vertex of the square is origin

$A(x_1, y_1) = (0, 0)$

Let other vertices be B, C, D

Line AB makes an angle of 30 degrees with the positive direction of x-axis in anticlockwise direction then coordinates of the point which is 2 units away from origin and lie above x-axis (i.e Point B) can be written as

$$B(x_2, y_2) = (x_1 + 2\cos 30^\circ, y_1 + 2\sin 30^\circ)$$

$$B(x_2, y_2) = (0 + 2\cos 30^\circ, 0 + 2\sin 30^\circ)$$

$$B(x_2, y_2) = (\sqrt{3}, 1)$$

Scanned by CamScanner

Similarly line BC makes an angle of 120 degrees (30+90) with the positive direction of x-axis in anticlockwise direction then coordinates of the point which is 2 units away from B and lie above x-axis (i.e Point C) can be written as

$$C(x_3, y_3) = (x_2 + 2\cos(120)^\circ, y_2 + 2\sin(120)^\circ)$$

$$C(x_3, y_3) = (\sqrt{3} + 2\cos(120)^\circ, 1 + 2\sin(120)^\circ)$$

$$C(x_3, y_3) = (\sqrt{3} - 1, 1 + \sqrt{3})$$

Scanned by CamScanner

Similarly line CD makes an angle of 210° (120+90) with the positive direction of x-axis in anticlockwise direction then coordinates of the point (i.e Point D) which is 2 units away from C and also 2 units away from A (because it is a square) can be written as

$$D(x_4, y_4) = (x_3 + 2\cos(210)^\circ, y_3 + 2\sin(210)^\circ)$$

$$D(x_4, y_4) = (\sqrt{3} - 1 + 2\cos(210)^\circ, 1 + \sqrt{3} + 2\sin(210)^\circ)$$

$$D(x_4, y_4) = (-1, \sqrt{3})$$

Let X be sum of x-coordinates

$$X = x_1 + x_2 + x_3 + x_4$$

$$X = 0 + \sqrt{3} + (\sqrt{3} - 1) + (-1)$$

$$X = 1.464$$
